

The quickest (in-flight) and most accurate method of determining which type of entry to perform, is to use the HSI and the 'thumb method' (use right thumb for standard holding and left for non-standard holding).

Example for standard holding :

1. Inbound heading to holding FIX - **315°**
2. Mark outbound course - **240°**
3. Right turns - **right thumb**
4. Check sector: **parallel entry**

### Quick review:

Standard Holding: **Right turns**

Non-standard Holding: **Left turns**
